

# Straight Lines

## 11<sup>th</sup> Maths - Chapter 10

This is Problem-8 from Exercise 2

1. Find the equation of line perpendicular distance from the origin is 5 units and the angle made by the perpendicular with the positive  $x$ -axis is  $30^\circ$

**Solution:** The equation of a line is given by

$$\mathbf{n}^\top \mathbf{x} = c \quad (1)$$

Let the normal vector of the line is

$$\mathbf{n} = \begin{pmatrix} \cos 30^\circ \\ \sin 30^\circ \end{pmatrix} \quad (2)$$

The distance from the origin to the line is given by

$$d = \frac{|c|}{\|\mathbf{n}\|} \quad (3)$$

The magnitude for  $\mathbf{n}$  is

$$\|\mathbf{n}\| = \sqrt{\left(\frac{\sqrt{3}}{2}\right)^2 + \left(\frac{1}{2}\right)^2} \quad (4)$$

From (3)

$$c = d \|\mathbf{n}\| \quad (5)$$

$$= \pm 5 \quad (6)$$

Then substituting them in (1) gives the equation of line

$$\begin{pmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \end{pmatrix} \mathbf{x} = 5 \quad (7)$$

$$\begin{pmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \end{pmatrix} \mathbf{x} = -5 \quad (8)$$
